

## InDesign Connect

Using InDesign Connect InDesign users can send the current document including extensive meta-data for further workflow control to Enfocus Switch (or other XML-enabled workflow systems).

### Work Control from within InDesign

InDesign Connect is the perfect solution for transferring one or multiple InDesign documents from within InDesign to a workflow without the users having to leave their familiar InDesign environment.

### Individually adjustable options and flexible Dialog management

InDesign Connect Dialog

### Transferring an XML control file

In this scenario only an XML control file is transferred to the Switch hot folder on the network. The XML file contains the full path to the InDesign file on a file server. Switch then takes over and processes the file fully automated, for example using the Switch InDesign Configurator or axaio's MadeToPrint Auto/Server Configurator.

### Saving the Selections

In every dialog you can define if InDesign Connect saves the selected options for text fields (e.g. the email address), checkboxes and radio buttons so that upon the next call-up of the dialog the values have been remembered.

### Validating input values

In order to make sure that only valid and useful information is collected for the metadata file you can set up validation for every single dialog element (for example for a valid email address or a certain scheme for file names).

### Dependencies

Dialog elements can activate or deactivate other dialog elements in order to avoid conflicting information in the metadata.

### Additional Information:

Requires Enfocus Metadata Modul (Switch Version 11 and up), PowerSwitch (up to Version 10)

InDesign Connect is designed in a way that its look and the available options dynamically adapt to the directory the InDesign document was opened from.

### Dynamic Display and selection of document-dependent values

The options visible in the InDesign Connect dialog adapt to the contents of the document.

### Output of all possible InDesign formats on the workstation

The output is generated on each workstation, for example as PDF, using user-defined or hard-wired output settings.

### Output as an InDesign Package (Package...)

An InDesign package with linked graphics and fonts is generated and transferred together with an XML control file to a hot folder on the network that is watched and processed by Switch.
